

Enterprise Admin and Custom roles and permissions

- Customers highly value "admin-level" access for streamlined configuration across multiple ENTs, by eliminating the need for frequent switching between ENTs (accounts).
- Centralized configuration aligns well with organizations that have a DAP Center of Excellence or central coordination, such as Uber and Sentry, fitting seamlessly into their structured management frameworks.
- For customers where content creation is led by non-L&D teams, like regulatory or engineering (e.g., Sanofi, Chubb), interest in the admin dashboard is mixed. These teams, often managing fewer ENTs, favour autonomy to maintain independent workflows and configuration per business unit.
- Most customers prefer a two-layered configuration setup, where org-level settings can be superseded at the ENT level, balancing centralised control with flexibility for specific needs.
- Customers have expressed interest in roles apart from Admin , such as an IT admin for deployment and security configurations to providing precise control over key settings without granting access to any workspaces
- Customers suggest refining the terminology for “Whatfix Home” and “Enterprise Admin Center” to ensure clarity and consistency across industries and geographies, enhancing user familiarity.
- Centralised user management was valued for simplifying tracking and management of users, improving administrative efficiency through single-point oversight. Also the capability to download audit logs of all users, their roles and the workspaces they belong to from a single platform
- Configuring styles and themes at the org level is a key feature that many customers are eager to see in the dashboard, with most preferring centralised control to ensure visual and branding consistency across their platform.
- Navigation is generally intuitive, though users recommend breadcrumb support to better indicate their location within Whatfix, improving orientation as they move across org and ENT levels.

✓ Sanofi - Sept 24th , 2024

Attendees:

Whatfix: Tejesh , Diya , Vignesh , Nisha Rawat (CSM)

Sanofi: Samantha (User Support Lead, Global Regulatory Operations

)Background :

Sanofi is a French multinational company focused on researching, developing, and producing prescription drugs, along with some over-the-counter medications . Sanofi uses Whatfix on two applications - Veeva Vault and Salesforce . Samatha handles the regulatory division and leads the content creation and management for Veeva Vault along with 3-4 content creators. For both the application , there are two separate teams operating with a good sense of autonomy with them

Agenda:

Concept testing meeting to validate Whatfix Home and the Enterprise Admin dashboard. The prototype also included custom roles, which we sought validation for.

Insights

- Samantha appreciated the general concept of configuring settings at an admin level without needing to switch between applications, seeing potential value for enterprises with more than 4-5 dashboards to maintain .
- Samantha does not believe org-level configurations are feasible at this time, given the autonomy each team has in using Whatfix. She expects this decentralized approach to continue unless Sanofi invests in a center of digital excellence for DAP, which would centralize content creation and management. As a result, org-level settings may not be practical in the current setup.
- However Samantha sees strong value in configuring settings at the sub-org level, particularly for regulatory applications. If Sanofi expands its use of Whatfix beyond a single application for their regulatory divisions , she would prefer centralised control over all regulatory apps to streamline management and ensure consistency across the division.
- Sanofi seeks to create roles for content reviewers who can approve content without editing it and for subject matter experts who can view analytics and configure analytics dashboards without creating/editing content.
- Samantha was neutral about having separate roles for each product line (DAP, PA). However , She emphasised the importance of an indicator to clearly identify which product lines a user has access to, thereby enhancing visibility for Account Managers

Attendees: Adina, Marianne, Chiranjeevi

Whatfix: Vignesh (PM), Tejesh (Design) Mohit (CSM)Whatfix Home & Workspaces

- **Purpose & Global View:** Adina asked for clarification on the purpose of **separate workspaces**. Once explained, she understood a **global view** where changes made at the admin level could apply to all workspaces at once, rather than individually.
- **Regional Customization:** She described their content creation process as starting with a **global template** (80% of the content), and then adapting it for **regional nuances**. Adina wanted to ensure they could manage both global and regional changes efficiently.

Navigation & Usability:

- **Ease of Use:** The Uber team found the **navigation intuitive**, particularly switching between workspaces and accessing teammate roles. She emphasized that this feature is crucial for their team.

SSO & Access Control:

- **SSO Configuration:** Adina expressed that **SSO setup** should be restricted to a **few people** within the organization like an **IT admin**, preferably not accessible to everyone.
- **Reporting Restrictions** Marianne shared her views about **limiting reporting access** to certain users at the workspace level. While not currently necessary, they could see a use case for restricting this in the future.

Custom Roles & Permissions:

- **View & Permissions:** Marianne highlighted the importance of **viewing custom roles and permissions**. She wanted a **downloadable list** showing all users and their respective roles, especially for audits.
- **Role-Based Privileges:** There was a suggestion to **limit specific admin tasks** (e.g., configuring APIs, adding users) to different teams, like engineering or management, depending on the task.

- **Comparing Custom Roles:** She suggested that being able to **compare permissions across multiple roles** side-by-side would be beneficial, especially if they create several custom roles with similar permissions.

Audit & Reporting:

- **CSV Export for Audits:** Adina and Marianne both emphasized the need for a **downloadable CSV file** to streamline the audit process. This would allow them to access **user roles and permissions** in bulk, reducing the time spent on manual checks in the UI

✓ Caterpillar - Sep 20th, 2024

Attendees: Shareen, Sneha, Saini,

Whatfix: Vignesh (PM), Tejesh, Diya (Design) Akansh

(CSM)Background: We conducted a usability study with Caterpillar to validate the first phase of Whatfix Home and the admin dashboard through two interactive prototypes. The first prototype provided an overview of Whatfix Home, focusing on user navigation and workspace access. The second prototype highlighted admin-specific functionalities within the dashboard, including workspace management, Single Sign-On (SSO) configuration, user invitation, and custom role creation for an org**Whatfix Home:**

1. Finds it **easy to use** and appreciates the simplicity for both admins and non-admins.
2. Suggested enhancing visibility of **admin controls** in a more intuitive way, especially for **SSO configuration**.
3. Confused on why it's mapped to an **application example (Salesforce)** and wanted to select a workspace based on the application

SSO Configuration & User Management:

1. Wants to **automate SSO setup** for new users when added, reducing manual configurations for multiple workspaces.

Teammates

1. The current teammate's setup feels **inflexible**. Shareen suggested a more **visual UI** to display roles and workspace access, particularly when multiple roles are involved.
2. Proposed a **hover-over** feature for quick role assignments or to view permissions, but feels it could be more intuitive.

Audit Logs:

1. Emphasized the **importance of audit logs** to track activity across workspaces and bring them on the admin dashboard, an ability to view audit logs
2. Improve **log visibility** for admins, especially when roles are changed or users are added to different workspaces. This would help ensure better **compliance and security**.

Workspace Access & User Status:

1. Suggested a feature that shows users' **last login date** to help admins manage **inactive users** more efficiently.
2. Raised concerns about how workspace access and role management are displayed, requesting clearer **indicators of user status**.

Future Configurations on Admin:

- Shareen is keen on future features where admins can **invite users and manage roles more directly** from the UI.
- She's looking for more flexibility in managing **teammates and roles**, with easier access to workspace-specific admin controls.
- Role segregation (e.g., no overlapping roles like Content Manager and Account Manager for the same person across different workspaces).

✓ Sophos - Sep 5th, 2024

Attendees: Remi

Whatfix: [@Vignesh Rengaraj](#) [@Tejesh Janardhan](#)

Background: We conducted a usability study with Remi to validate the first phase of Whatfix Home and the admin dashboard through two interactive prototypes. The first prototype provided an overview of Whatfix Home, focusing on user navigation and workspace access. The

second prototype highlighted admin-specific functionalities within the dashboard, including workspace management, Single Sign-On (SSO) configuration, user invitation, and custom role creation for an org

Insights from Remi:

Remi suggested several improvements to enhance the usability and functionality of the Whatfix Home and admin dashboard. One key recommendation was to introduce the ability to configure styles at a top level, which would ensure consistent design across all workspaces. This global style management feature could significantly simplify the process of maintaining a cohesive look and feel within the platform. Additionally, Remi highlighted the need for more efficient team management, particularly in larger organizations. He recommended implementing a feature that would allow teams to be created automatically based on Active Directory (AD) groups, streamlining the process of managing user groups and roles. Another area for improvement was the visibility of user roles within the dashboard. Remi suggested having clearer role indicators to help users quickly identify which roles apply to which workspaces, reducing potential confusion and enhancing the overall user experience. Remi also raised concerns about access control for non-admin users, emphasizing the importance of balancing workspace visibility with appropriate access limitations. While non-admin users should be able to see their teammates and access relevant workspaces, they should not have access to settings beyond their designated roles. This would ensure a more secure and role-appropriate use of the platform.

✓ Sentry - Nov 13th, 2024

Customer Name: **Sentry**

Meeting date: Nov 4, 2024

Attendees: Christopher

Whatfix: [@Vignesh Rengaraj](#) PM, [@Tejesh Janardhan](#) Design
[@Andre Pereira](#) CSM

Current setup

Sentry currently has eight dashboards, with a ninth expected to go live soon. Of these, five are actively used, while three see limited engagement. For example, the 'Insight' application dashboards aren't accessed as frequently. Sentry's team, which includes around 15-20

members, accesses the dashboards as needed, depending on the applications they're working on.

Admin Dashboard Overview

As an admin, Chris finds the Admin dashboard intuitive for overseeing team settings and managing access by role. It would be even more effective with options to view/edit roles and remove members directly.

Workspace organization and user-role mapping are useful.

Inviting New Teammates

The invitation process should be straightforward similar to the

Enterprise setup, which makes it easy to use.

Workspace and Role Management

Seeing roles for each user across workspaces adds a lot of value. For example, different departments like IT or Claims can have specific roles and permissions. Clearly labeled workspaces make it easy to

understand what application access is available.

Custom Roles and Permissions

Chris liked the option to create custom roles, which would be helpful for specialized teams, such as learning experience and leadership roles.

Setting permissions specific to each application or dashboard, while limiting publishing rights, supports the tailored responsibilities they need.

The ability to set global configurations with local overrides would simplify our process significantly. If global custom roles could apply universally or just to specific workspaces, it would save us time and reduce manual adjustments.

Settings and Single Sign-On

While Sentry is not currently using SSO, can see the benefit of managing multiple SSO points for various departments in the future. It would be helpful if only select admin users could access these configurations. (New IT admin role)

Workspace Navigation

Chris suggested a folder structure to help organize access for different teams, so only relevant users like IT, personal lines, or Century U teams see their respective workspaces/folders.

Clear navigation paths clicking on the primary logo leads to Whatfix Home.

Customer: Chubb

Attendees:

Whatfix: Tejesh , Diya , Vignesh , Vivek (CSM)

Chubb: Mitchell Ross , Shivani Sachdeva , Steve Wellden (Engineering team)**Background:**

Chubb is a leading global insurance company with operations in 54 countries. It offers commercial and personal property and casualty insurance, personal accident and health insurance, reinsurance, and life insurance to a wide range of clients. Chubb employs over 40,000 people worldwide**Business objective:**

Chubb uses Whatfix to support HR functions and improve internal processes. Examples include providing guidance and hints to agents while creating insurance quotes, leveraging Whatfix context to reduce process time, and helping end-users transition smoothly to upgraded application instances**Team structure:**

Chubb manages 6-7 dashboards, with most content creators having access to only 1-2 dashboards. Mitchell is an exception, with access to the majority of them. Currently, they lack a central entity or executive sponsor, and different teams independently handle content creation and maintenance.**Agenda:**

Concept testing meeting to validate Whatfix Home and the Enterprise Admin dashboard. The prototype also included custom roles, which we sought validation for.**Insights:**

- Chubb has started Whatfix usage with one group initially and is gradually scaling across the organization. Currently, five groups manage separate dashboards without centralized governance or an executive sponsor.
- Mitchell shared that their long-term goal is to centralize content creation and management under a dedicated team. They believe the admin dashboard will deliver immense value once a L&D team or a central coordinating group is established. Currently, content creation is managed by engineers with other responsibilities
- A similar trend was seen in Sanofi, where two divisions independently create and maintain content, where they also mentioned that the value potential would be significantly higher once they streamline the DAP operation into a single team .This reinforces

the observation that decentralized content authoring teams may find relatively limited value in the admin dashboard concept

- Chubb suggested UI improvements to enhance navigation between the admin dashboard, workspaces, and product lines, making it easier for content authors to keep track of their current level
- The team found some of the terminology, such as "Dashboard," "Whatfix Home," and "teammates," confusing and suggested adopting clearer, more relatable names

✓ Marriott - Dec 12th, 2024

Customer: Marriott

Date : 10/12/2024

Attendees:

- Whatfix: Tejesh, Vignesh, Tej (CSM) , Nishant (CSM)
- Marriott: Stephanie Dull

Background:

The call focused on concept testing for Custom Roles and Permissions and the Enterprise Admin Dashboard.

Team Structure:

- Marriott currently manages 14-15 dashboards, with plans to onboard 20 more applications in the next 2-3 years.
- The team is organised as follows:
 - a. Instructional Designers: Create content in the dashboards.
 - b. SMEs: Review and test content in preview mode, providing feedback to instructional designers.
 - c. Product Owners: Typically directors, responsible for project management and occasionally reviewing digital adoption analytics.

Insights on Enterprise Admin Dashboard concept:

1. Theming and Styling Configuration:

- Stephanie values the ability to configure themes and styles centrally through the Enterprise Admin Dashboard.
- She prefers consistent theming across most applications, except when global themes conflict with host application themes.

2. Actionable Metrics for High-Level Monitoring:

- Stephanie expressed interest in an eagle eye view on actionable metrics, as she does not log into individual applications frequently.
- Suggested metrics include:
 - Number of content items in Draft/Ready/Production stages.
 - Concern: Excessive content in Draft indicates bottlenecks in the content release cycle.
 - Root Causes:
 1. Dependence on AM roles for P2P operations causing delays.
 2. Authors creating content but not pushing it forward.
 - Number of content breakages in specific workspaces
 - A single encapsulated metric for each workspace to summarise its digital adoption status, although the definition for this metric is still something which Stephanie is figuring out

3. Configuration Controls at Org and Workspace Levels:

- Stephanie strongly prefers configurations to be available at both organization and workspace levels.
- She does not see the need for strict org-level controls and feels tampering risks at workspace level are mitigated with custom roles.

4. Workspace terminology

- Stephanie prefers the term "Workspace" over the existing term "Dashboard," as she believes "Dashboard" is more suited for showcasing analytics or metrics. In contrast, "Workspace" is a more comprehensive term that encapsulates all aspects, including content creation, maintenance, and viewing analytics

Role-Based Suggestions for Custom Roles and Permissions

Concept:

1. Analytics-Only Role:

- A role for product owners (directors, VPs) focused solely on analytics.
- It eliminates the cognitive overload caused by navigating the guidance screen to access analytics.

2. Comms Role for Incident Notifications:

- A role dedicated to creating pop-ups for notifying users about outages or incidents in the application
 - Stephanie would appreciate ready-made business templates for such notifications, enabling:
 - Faster deployment of critical content
 - Minimal training for Comms role users.
3. Content Manager with P2P permissions to eliminate dependency on the Account Manager in the content release process

Additional Feedback:

1. Differentiation in Preview Mode:
 - SMEs who test content in preview mode would benefit from a color-coded system to distinguish between Draft and Ready content.
 - Currently, there is no way to visually differentiate between these two states, making their work more challenging

✓ Arrow - Dec 23rd, 2024

Usability feedback session - Custom roles and permission

Customer Name: Arrow

Meeting date: Dec 23rd, 2024

Attendees: Chris, Shaun

Whatfix: [@Tejesh Janardhan](#) (Design), [@Siddharth Maheshwari](#) (CSM)Background

Chris provided a detailed overview of Arrow's operations, highlighting the complexity and scale of their organisational needs. Arrow manages over 40+ applications across North America, EMEA, and other regions using a unified dashboard. This setup facilitates seamless content sharing and onboarding across regions but poses significant challenges for role management and security. The current system's limitations require assigning full system administrator rights to team members to perform specific tasks, which complicates supervision and role description.

Insights on Custom roles and permissionsCurrent challenges

Arrow's single dashboard for managing 40+ applications across regions highlights the need for a scalable and user-friendly admin tool like Admin dashboard.**Permissions:** Chris and Shaun both stressed the necessity of being able to assign specific roles and permissions to work groups, such as folder access or application-specific tasks, without overextending roles.**Role Hierarchy Requirements:** There's a need to create multiple supervisory levels to outline responsibilities, for example

- Super Administrators for system-wide user management.
- Regional or functional administrators for task-specific operations.
- Reviewers who can access and review content without editing.

Prototype Feedback

- **Custom Role Creation:** Chris liked the flexibility to create custom roles with granular permissions, drawing parallels to Salesforce's permission structure.
- **Spreadsheet View:** The spreadsheet-like view for a list of permissions was appreciated for clarity and usability. Chris highlighted its alignment with his earlier suggestions.
- **Folder-Level Permissions:** The ability to assign permissions at the folder level, while not currently available, was highlighted as a critical feature for better access control.

Key Takeaways

- Restricting the ability to invite users to specific regions (Folders)
- Assigning region-specific administrators who can manage workflows, review, and push content to production.
- Creating reviewer roles that allow access to content without editing permissions.
